

Adding XB 2.8 G.E.M. to Classic99

I have my cartridges in a folder named CARTS. Here XB28GEM is shown. In Classic99, if you go to Cartridge>User>Open this will show up. You can click on either file and it should start up properly.

Once it is in CARTS or another folder you have the option of adding it to Classic99's .ini file. Here is my entry for XB 2.8 G.E.M.

```
[usercontent1] (I have another cart which is usercart0)
name=XB 2.8 G.E.M
rom0=G|6000|A000|CARTS\XB28GEM_G.BIN
rom1=8|0000|22000|CARTS\XB28GEM_8.BIN
```

By adding this to the .ini file this automatically shows up when you click Cartridge>User. You don't have to open anything. Also, if it is in the .ini file you can close Classic99 and when you restart Classic99 again XB 2.8 G.E.M. will automatically be loaded.

You will need to restart Classic99 for the .ini change to take effect.

The colors and font used in the editor were sometimes corrupted when using the NanoPEB. (Both G.E.M. and the nanoPEB make use of the same “unused” memory locations.) To assure compatibility, XB 2.8 G.E.M. has been modified to use memory at 9456 and 9457 for color information and the font number. (Earlier versions used memory at -2 and -1 for this.) Some E/A5 programs can overwrite these two bytes. If that happens then the default colors and fonts are loaded.

Final Grom

To be able to use the Final Grom you need to rename the two files:

XB28GEM_G.BIN	should be	XB28GEMG.BIN
XB28GEM_8.BIN	should be	XB28GEMC.BIN
